

Subscriber Identity Module Card Backup System

5

ABSTRACT

10 An apparatus for backing up the storage data from a subscriber
identity module card will comprise said followings: the subscriber
identity module card connector, a central processing unit, a serial
electrically erasable programmable read only memory, the displays, the
power supply and the inputting device. Firstly, inserting a first
subscriber identity module card into a subscriber identity module card
connector of the subscriber identity module card backup system is
15 carried out. Then, a first storage data from the subscriber identity
module card is extracted and treated to a memory whereby a central
processing unit. Next, backing up the first storage data into the
memory whereby said central processing unit is achieved. Sequentially,
the first subscriber identity module card can be removed from the
20 subscriber identity module card connector. Next, a second subscriber
identity module card is inserted into the subscriber identity module
card connector. Finally, the first storage data is duplicated from the
serial electrically erasable programmable read only memory into the
second subscriber identity module card in order to back up the first
25 storage data from the first subscriber identity module card to the
second subscriber identity module card.
